

Scenario Based Interview Questions: Part 1

1. A Dataverse flow triggers 4 times for a single Account update. What are the possible reasons?
2. Saving a record takes 30+ seconds. How would you troubleshoot it and reduce the time?
3. A scheduled flow set for 9:00 AM starts at 10:00 AM. Is it a bug or expected behavior?
4. Need to update 10,000 records after a configuration change. Would you use Plugin, Power Automate, Custom API, Azure Function, or something else? Why?
5. A plugin works in Dev Env but fails in UAT Env without any code changes. What would you check?
6. A ribbon button throws getFormContext is not a function, but the same code works in Form OnLoad. Why?
7. JavaScript prints the correct value in the console, but the form field never updates. What could be the reason?
8. A flow returns only half the expected Accounts even though query looks correct. What's the most likely cause?
9. A workflow stops working after a solution deployment, even though it wasn't modified. What could have happened?
10. To prevent duplicate records, would you choose a Plugin, Alternate Key, Duplicate Detection Rule, or Power Automate? Why?
11. A plugin executes twice, but only one step is registered. What could be the reason?
